

8.5 Solving Exponential Equations

<p>A One-to-one property</p> <p>The exponential function is <i>one-to-one</i> function. So:</p> $a^x = a^y \Leftrightarrow x = y$ $a > 0, a \neq 1, x \in R, y \in R,$	<p>Ex 1. Solve the following exponential equations.</p> <p>a) $2^x = 64$</p> <p>b) $10^{2x-3} = 0.0001$</p> <p>c) $2^{-x} = \sqrt[5]{16}$</p> <p>d) $8^x = \sqrt[3]{0.0625}$</p>
<p>B Change of Variable</p> <p>Sometimes, <i>changing of the variable</i> may help solving the exponential equation. For example:</p> $a^x = y; \quad y > 0$	
<p>Ex 2. Use the change of variable method to solve each of the following exponential equations.</p> <p>a) $2^x + 2^{-x} = 4.25$</p> <p>b) $5 \cdot 2^x - 4^x + 24 = 0$</p>	<p>c) $\frac{2^x - 2^{-x}}{2^x + 2^{-x}} = -\frac{63}{65}$</p> <p>d) $2^{x+1} + 2^{2x} = 2^x + 2 + \sqrt{2}$</p>

<p>C Logarithms</p> <p>Sometimes, <i>logarithms</i> are needed in order to solve exponential equations.</p>	<p>Ex 3. Solve each equation using logarithms.</p> <p>a) $2^{3x-1} = 5$</p> <p>b) $3^{x-1} = 4^{x+1}$</p>
<p>D Applications</p> <p>Many <i>applications</i> are related to solving exponential equations.</p>	
<p>Ex 4. A species of bacteria doubles each 10 minutes. The initial number of bacteria is 200 .</p> <p>a) Find the exponential function describing the bacteria population growth.</p> <p>b) Find the bacteria population after one hour.</p> <p>c) Find the time (in minutes) after which the bacteria population is 123456 .</p>	<p>Ex 5. A 100 g sample of plutonium-238 has a half-life of 88 years.</p> <p>a) Find the exponential function describing the radioactive decay.</p> <p>b) Find the mass of radioactive source after 10 years.</p> <p>c) Find the time (in years) after which the mass of the radioactive source will be 3.21 g .</p>
